RS-232C Protocol

June 2008

Version 0.01.00

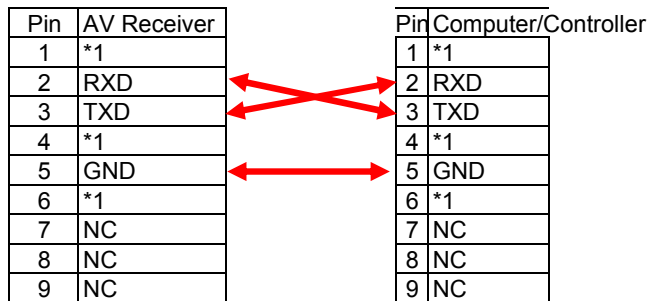

For Custom Installation

Physical Cable Connection

Connector

RS232C DB9 Male

Pioneer A/V Receivers use a "crossover" (aka/"null modem" or "twisted pair") cable.

*PinS 1, 4, & 6 are shorted to each other.

RECEIVER PINOUTS

Communication

Communication Speed : 9600bps

Protocol Type : 8data bits,1stop bit,no parity

Notice1

To meet stringent power conservation measures Pioneer A/V receivers consume less than 1 Watt when in the "Standby" or "Off" mode.

To achieve this the main CPU doesn't operate in Standby/Off.

For this reason the receiver may not understand the first command send to it's the RS-232C port but the main CPU will "wake up" with the first command.

In other words, the receiver is using the first command as a trigger to wake up the main CPU and may not respond correctly to it.

For the proper execution of the first command please send the command twice.

Also, please make sure to have at least a 100msec. interval between the first and second command.

Example1

```
PO<CR>
↓
100msec Wait
↓
PO<CR>
```

Notice2

It takes a brief amount of time for the receiver to respond to a command like "Surround Mode" from your control system.

When the receiver receives a command it writes that information to the EEPROM.

Accordingly, you have to keep at least 100msec. before you do a "TIMEOUT" after sending the command to the receiver.

Example2

SR: The receiver's response to the command for PRO LOGIC II MUSIC.

```

Control System      Receiver
014SR<CR>          →  Receives the command and writes the info to the EEPROM.
                        ↓
                        ↓ 100msec
Confirmation        ←  SR014<CR+LF>

```

Notice3

The interval between each response sent from the receiver is 20msec.

Therefore you have to wait at least 20msec. before a "TIMEOUT".

Example3

?F: Responding to a request for the current function (input).

```

Automatic Feedback

When the input or function status is changed using buttons on the front panel or the remote control of the receiver, the receiver will send it's new status automatically. (VOLXX,PWRX,MUTX,FXXX,SRXXXX,LMXXX)

(For example) The user changes a function on the front panel.
Receiver sends: FNXX<CR+LF>

X:Argument:ASC code

When you set the "Listening Mode"with the product front panel keys and knobs,
you are operating the "LISTENING MODE SELECTOR" knob or the "LISTENING CH SELECT"button.
Depending on the source, there are some modes which are not available.
Automatic detection for 2ch, 5.1 ch, and 6.1ch is not always available.

With the "SR" command, you can select whichever mode you wish.
Also, you can confirm your selection with the "SR" command by "7S" command.

*) When the LISTENING MODE is changed, the set will dispatch an ANSWER command to let the external controller know the current status automatically; even without receiving a LISTENING MODE SETTING REQUEST from the controller. (Automatic Feedback [1-3byte]:data for mode setting.
Below are the command combinations for the LISTENING MODE command.

Example

Command 0001SR<CR>	set STEREO mode.

*5 LISTENING (DECODE) MODE REQUEST[3byte]

Below is the list indicating the combination of the LISTENING MODE selected by "SR" command and the LISTENING MODE determined by the input source signal.

When the LISTENING MODE is set and the format for the source signal is confirmed, the receiver will send an ANSWER COMMAND to the controller to let it know the LISTENING MODE status. It replies automatically and does not need to receive a LISTENING MODE REQUEST.

(Automatic Feedback)

LISTENING MODE shows the current signal format the receiver is detecting or the surround mode which has been added to the original signal.
