1. Outline

In case no comments in particular as for the contents of this papers, the descriptions are effective for RX-V4600

1.1 Connection

5 wire system

	TxD(PIN3)	Transpose	>	RxD(PIN2)	
	RxD(PIN2)	receive	<	TxD(PIN3)	
RX-V4600	GND(PIN5)	Ground		GND(PIN5)	HOST.
Slave	CTS(PIN8)	permit to send data	<	RTS(PIN7)	master
	RTS(PIN7)	request to send data	>	CTS(PIN8)	
*When not o	connected, data	sending to RX-V4600	is prohibited	(CTS port pull d	own).

1.2 RS-232C Settings

* Full duplex, start-stop synchronization communication

Baud rate : 9600bps
Data bits : 8
Parity : No
Stop bit : 1bit
Handshaking : Hardware

*RTS port of VRX-V4600 outputs low level while the AC plug is disconnected.

If RTS output stays low even when the AC plug is connected, there might be some trouble.

1.3 Data block timeout

It takes RX-V4600 maximum 500msec to send one data block. If a complete data block is not received within 500msec, please cancel the transaction. There might be some trouble.

2. Start transactions

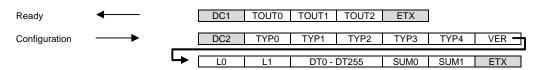

2.1 Starting Communication

Ready command is the very first command to be sent to RX-V4600 at the start of the communication. TOUT0 - 2 in Ready Command sets timeout of the communication.

RX-V4600 sends Configuration command (Model ID, software version, and setting data) to the host in reply to the Ready command.

RX-V4600 will send a Configuration command within 1 sec. after receiving a Ready command from the host. If not, please send a Ready command again (max 5 times). If RX-V4600 won't send any Configuration commands after fifth retry, please cancel the transaction because there might be some problems.

*TYPx : Model ID = "R0190" (RX-V4600)

*VER : Software Version

*SUM : the sum of all data except for the header and footer

function name	function	data (ASCII)	range (HEX)
TOUT0 - 2	communication timeout	0 - 9, A - F	0 - 0xFFF

^{*}timeout between the header and the footer

*timeout=0 means no timeout

function name	function	data (ASCII)	range (HEX)
TYP0 - 4	model ID	0 - 9, A - F	voluntary
VER	software version	A - Z	voluntary
L0 - 1	data length	0 - 9, A - F	1 - 0xFF
DT0 - 255	data	0 - 9, A - F	0 - 0xF
SUM0	upper 4 bit of SUM	0 - 9, A - F	0 - 0xF
SUM1	lower 4 bit of SUM	0 - 9, A - F	0 - 0xF

*Data Structure of Configuration command data When the power is OFF, only DT0,1,...,9 are sent to the Host.

*DD = Dolby Digital

^{*}OSD = On Screen Display

3. Control Command

RX-V4600 can receive control commands only while the power is on. (Except Power commands and System commands)

*Please do not send any control commands while the system status is in wait. No commands are permitted until RX-V4600 reports OK

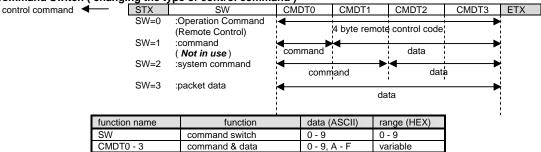

*RX-V4600 will send a Report Command** within 1 sec of receiving the Control Command. If no Report Command is received, resend control command (max 5 times) If RX-V4600 doesn't send a Report Commands after fifth retry, cancel the transaction because there might be some troubles.

*'SW' switches the type of the control command. When the 'SW' is set to '0', you can control RX-V4600 remotely via RS-232C.

*RX-V4600 will only send one report command for each type of control. The Report Command will report only the final status of all settings in a strings of commands (may not report all steps in a status, only final status). For example, if a user set the input selector on the unit to D-TV/LD just after the host sends command to change input to CD, RX-V4600 may report only the final status that the input was changed to D-TV/LD by the system operation.

*System command, **Report command --> described in later

- Command Switch (changing the type of control command)

* 'SW' switches the command type of the Control Command.

SW=0 : 4 byte command for remote control code

SW=1 : 1 byte command 0 - F (HEX expression in ASCII) SW=2 : 2 byte command 10 - FF (HEX expression in ASCII)

SW=3 : 4 byte packet data

- * RX-V4600 uses following three types of Control Command.
 - Operation Commands for remote control (SW = 0)
 - System Commands for system setting (SW = 2)
 - packet data for test data transmission (SW = 3)

3.1 System Command (SW = '2')

System Command can be made by setting the 'SW' byte in the Control Command to '2'. With System command you can control RX-V4600's system settings (Report Command Enable / Disable, Report Command delay, etc.)

With a System Command you can also ...

- set absolute master volume value.
- send text strings to the On Screen Display (OSD).
- request RX-V4600 text data regarding tuner freq., master volume, input name, zone2 input name.

(from RX-V4600)

: Not supported by RX-V4600 Series

7

^{*1:} acceptable only in the status of Power OFF.
*2: acceptable only in the status of Advanced Setup ON.

*OSD message function

OSD Message function can display a message of 16 characters to RX-V4600's OSD for a few seconds. The command sequence block will start by sending "start command" as mentioned above, followed by 4 bytes of packet data (SW:3) repeated four times. Then the message of sixteen characters(ASCII) will display and the command block finish automatically. (ex.)Want to display "Test message!" characters to OSD.

1. Send the start command.

		STX	2	1	0	0	0	ETX		
2.	Send SW:3 commands four times as follows.									
		STX	3	. ,	'T'	'e'	's'	ETX		
		STX	3	't'		'm'	'e'	ETX		
		STX	3	's'	's'	'a'	ʻg'	ETX		
		STX	3	'e'		"!"		ETX		

3. The command block will be finished automatically.

The available characters to display the message are as follows.

*Commands to get the display characters as text data(ASCII)

This command can get certain of text data(ASCII) from the RX-V4600 to be used by Host device as follows.

- Tuner frequency characters : " 107.9 "(MHz)
- ➤ Master volume value characters : " –99.0dB" / " MUTE"
- Input name: "MY PC" (Even renamed by "SET MENU:INPUT RENAME")
- Zone2 input name: "PS 2" (Even renamed by "SET MENU:INPUT RENAME")

The response protocol for the text request commands are as follows.

RCMD0,1	COMMAND	0 – 9,A - F	00xFF
DDAT	DATA	0 – 9,A - Z	ASCII char.
0 - 7		SP	Space char.

4. Reset Command

Reset Command recalls factory preset data. Once the factory preset are recalled, all user controllable setting / parameter data will be deleted and replaced with original factory settings.

Please do not use this command unless you have been experiencing problems with the system or if you just want to clean up the system.

After the system is reset, please request the Configuration Command using Ready Command (see section 2) in order to get accurate feedback of status of RX-V4600 to your touch panel system.

Ready	←	DC3	DEL	DEL	DEL	ETX	*recall factory preset of all data

5. Report Command

RX-V4600 will send Report Command in response to Control Commands from the host controller. From Report Command you can receive the current status of the RX-V4600.

There are three types of Report Command classified by their information type.

- System Status Report : RX-V4600 reports a System Status Report when the system status changed.

- Playback Status Report : RX-V4600 reports a Playback Status Report when the internal playback status changed.

- Operation Report : When the RX-V4600 is controlled by remote controller, front panel, RS-232C or by system controller, RX-V4600 sends a Operation Report, which includes the latest setting status of

the controlled function.

*RX-V4600 reports a System State Report with system guard to inform its power status (power off) when a control command was sent to RX-V4600 while it's turned off.

*The guard status is included in the Report Command (GRD). If the control command the host sent was accepted by RX-V4600, the guard status in the Report Command is '0' (No Guard). On the contrary the guard status will be 'System Guard' or 'Setting Guard' when the command was guarded for some reason (e.g. If you send a 'Speaker A ON' command while you are using a headphone, the guard status will be 'System Guard' because the speaker controls are prohibited by system while a headphone is used.)

*If a status changed multiple times in a certain time, RX-V4600 report only one report command.

function name	function	data (ASCII)	range (HEX)
TYP	control type	0 - 9	0 - 9
GRD	guard status	0 - 9	0 - 9
RCMD0, 1	command	0 - 9, A - F	0 - 0xFF
RDAT0, 1	data	0 - 9, A - F	0 - 0xFF

<Control type> This indicates for which type of control the report command is.

TYP	control type
0	controlled by RS-232C
1	controlled by remote controller (I/R)
2	controlled by keys in the unit
3	controlled by system
4	controlled by encoder

< Guard status > This indicates guard status against all control command

GRD	Guard status*	
0	no guard	
1	system guard	
2	setting guard	

^{*}see the following chart

*Factor of the guards and the contents informed in report commands when there are no guards

operation	no guard	system guard	setting guard
Power Power status			
Input	6ch input/ selected input

Attention

*When the Input is changed, RX-V4600 sends Operation Report for Input (RCMD0,1="21") and Input mode(RCMD0,1="22").

*When the Home bank is changed, RX-V4600 sends Operation Report for Home bank (RCMD0,1="30") and Configuration Command.

*When a headphone is plugged into the headphone jack and Speaker Relay turned off, RX-V4600 send the Operation Report for Speaker Relay A and B (RCMD0,1="2E","2F", RDAT="00(OFF)"). RX-V4600 sends the Operation Command for Speaker Relay A and B when the headphone is removed also.

*Each time the source from the Inputs or playback status (ex. 6.1/ES, RED dts etc.) of the system changes, RX-V4600 send a Playback Status report.

*Each time the busy status of the system changes, RX-V4600 send the System Status report.

Example of RX-V4600 Control Procedure

[1] Connection Start procedure (AC Plug / RS-232C cable connection)

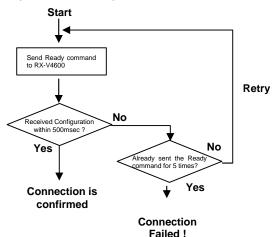

When the AC plug / RS-232C cable are not connected, RX-V4600 cannot send any data to host. If the host doesn't receive a configuration command after sending Ready command 5 times, host should disable the RS-232C communication of the host and send alert to the graphic user interface (GUI).

[2] AC plug / RS-232C connection check sequence after the connection has been confirmed in the procedure [1].

If the host doesn't receive a Report Command within 500ms of sending a command, the host should resend the command. If no Report Command is received after sending 5 times, check AC plug/RS-232 cable (see [1]).

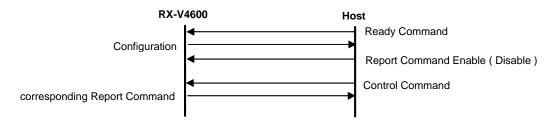

When the RS-232C cable is disconnected, the commands generated inside RX-V4600 are stored in the sending buffer. If the stored commands exceed the bufer memory size (buffer overflow), RX-V4600 stops reporting any commands. In this case, reconnecting AC plug or Connection Start procedure [1] will be needed in order to enable the command report.

[1]: AC Plug / RS-232C connection check (Start transaction)

[3] AC plug connection detection (after [1],[2]) When the AC connection is reset, RX-V4600 send Configuration Command to the host. Host can feedback the status of RX-V4600 to its GUI.

[4] Getting the status of the RX-V4600 when the host boot up
At first, host should send Ready command and receive the Configuration Command from RX-V4600 (see [1]).
Once the connection is confirmed, host can send Control Commands to the host. While the RX-V4600 is turned off, RX-V4600 only

[5] Error transactions after [4]

accept System Command and Power ON command.

While sending control command, if RX-V4600 didn't send any corresponding Report Commands regardless of re-trying for 5 times, host should clear its send buffer and then check AC plug / RS-232C connection sequence (see [1]). When the RX-V4600 responded, the host can feedback the RX-V4600 status to its GUI then return to the normal communication sequence. If not, the host should cancel the communication and report the alert to its GUI.
